

Week 1: Hello, World!

Overview

This assignment turns Week 1 concepts into a small, finishable Java program or project milestone. Start from the provided template, preserve the public class filename, and run the program in IntelliJ before submitting.

Objectives

- Recognize the class and main method in a Java program.
- Use `System.out.println` to display text.
- Create and run a Java file in IntelliJ IDEA.

Required reading - one new chapter

- [Think Java Chapter 1 - Computer Programming](#)

Interactive practice

- [Runestone: first Java programs](#)

Supplemental videos

- [Start coding with Java](#)

Complete these steps

- Open IntelliJ IDEA and choose New Project.
- Select Java, choose OpenJDK 26, keep the build system set to IntelliJ, and name the project Week01HelloWorld.
- In the Project panel, right-click src and choose New > Java Class.
- Enter HelloWorld exactly. IntelliJ creates HelloWorld.java and a matching class.
- Inside the class, type the main method shown in Chapter 1.
- Inside main, add `System.out.println("Hello, World!");`
- Use the green triangle beside main and choose Run 'HelloWorld.main()'.
 - Confirm the Run window displays Hello, World!
- Save and submit HelloWorld.java. Do not submit a screenshot instead of the Java file.

What will be checked

Use this list as your final review before submitting.

- The file is named HelloWorld.java and contains class HelloWorld.
- A main method is present.
- The program prints Hello, World! exactly.
- The submitted file contains no unfinished TODO marker from the starter template.

OpenJDK 26 and IntelliJ setup

Install a standalone OpenJDK 26, then install IntelliJ IDEA. The JDK contains the compiler and runtime; IntelliJ is the editor and project workspace. Do not select IntelliJ's bundled runtime as the project JDK.

- [OpenJDK 26 downloads](#)
- [Download IntelliJ IDEA](#)
- [JetBrains SDK setup guide](#)

Windows 10/11

- Download the Windows x64 OpenJDK 26 archive and extract it to a permanent folder such as C:\Program Files\Java\jdk-26, or use IntelliJ's Download JDK command and choose OpenJDK 26.
- Open Command Prompt and run `java -version` and `javac -version`. Both must begin with 26.
- Install IntelliJ IDEA with the Windows installer and keep the default options.

macOS

- Apple menu > About This Mac: Apple M-series uses ARM64; Intel Macs use x64.
- Download the matching OpenJDK 26 archive, install/extract it, then verify `java -version` and `javac -version` both begin with 26 in Terminal.
- Download the matching IntelliJ DMG, drag IntelliJ IDEA to Applications, and open it.

Linux

- Run `uname -m`: x86_64 uses x64; aarch64/arm64 uses ARM64.
- Download the matching OpenJDK 26 archive, extract it to a permanent JDK folder, and configure `JAVA_HOME`/`PATH` if your distribution does not do so automatically.
- Verify `java -version` and `javac -version` both begin with 26. Install IntelliJ using JetBrains Toolbox or the official Linux archive.

Create and run the first project

- Open IntelliJ IDEA. On the Welcome screen choose New Project.
- Select Java on the left. Set Name to `Week01HelloWorld` and choose a location you can find again.
- For JDK, select OpenJDK 26. If it is missing, choose Add JDK from Disk and select the JDK home folder, or choose Download JDK and select version 26.
- Set Build system to IntelliJ, leave Add sample code off, and choose Create.
- In the Project panel, expand the project. Right-click `src` and choose New > Java Class.
- Type `HelloWorld` exactly and press Enter. IntelliJ creates `HelloWorld.java`; a public class filename must match its class name exactly, including capitalization.
- Type `public static void main(String[] args)` inside the class, then add `System.out.println("Hello, World!");` inside `main`.
- Select the green triangle beside `main`, choose Run '`HelloWorld.main()`', and look for Hello, World! in the Run window.
- If Project SDK is not defined, open File > Project Structure > Project and select OpenJDK 26. Do not select `jbr`, which is the runtime used to launch IntelliJ itself.
